

# ***Analysis of Satellite-Based TC Intensity Estimation in the WNP***

**Chris Velden and Derrick Herndon**

***University of Wisconsin - Madison***  
***Cooperative Institute for Meteorological  
Satellite Studies (CIMSS)***

**Meteorological Satellite (METSAT) Conference**  
**Ford Island Conference Center**  
**Pearl Harbor, HI**  
**27-28 April 2009**

***Research supported by***  
***the ONR Marine Meteorology and Atmospheric Effects Program***

# ***Analysis of Sat-Based TC Intensity Estimation in the WNP***

## **Objectives and Motivation**

**Satellite-based recon is the workhorse for TC monitoring in the WNP, yet the intensity estimation methods have not been carefully validated since a/c recon left the WNP 23 years ago**

**Newly-developed automated methods have become operationally available and show promise, but have only been validated in the Atlantic**

**The TCS-08/TPARC campaigns in 2008 offered a rare opportunity for in situ observations of WNP TC core intensities, and validation of satellite-based**

# ***Analysis of Sat-Based TC Intensity Estimation in the WNP***

## **Assets brought to the WNP for the TCS-08/TPARC field campaigns**

**USAF C-130 from the 53<sup>rd</sup> WRS, with Dropsondes  
and SFMR**

**NRL P-3, with Dropsondes and Eldora radar**

**Drifting buoys deployed by the C-130**

**Period of deployment: Early Aug. through mid-Sept.**

# ***Analysis of Sat-Based TC Intensity Estimation in the WNP***

## **Satellite-based Methods to be Validated**

***Dvorak Technique*** -- IR/VIS, Primary operational  
tool, Manual

***Advanced Dvorak Technique (ADT)*** -  
Objective/Automated

***Advanced Microwave Sounding Unit (AMSU)*** -  
Obj/Auto, Method based on polar-orbiter 54GHz  
microwave data

# ***Analysis of Sat-Based TC Intensity Estimation in the WNP***

## **Validation Experiment Set-up**

**Automated ADT, AMSU and SATCON all run and documented at CIMSS in real time (CIRA-based AMSU estimates also made available to CIMSS in real time)**

**Real time operational Dvorak estimates collected from JTWC, NESDIS-SAB, and JMA**

**Independently-derived Dvorak estimates by 5 experienced satellite analysts 'blind' to the real time recon data and operational Dvorak estimates were made available to CIMSS following the field experiment**

# ***Analysis of Sat-Based TC Intensity Estimation in the***

## ***WNP***

### **Validation Experiment Setup - Additional Notes**

**ADT run in two modes: With and w/o microwave  
input**

**AMSU estimates from two methods: CIMSS and CIRA  
(CIRA occasionally unavailable due to method  
constraints)**

**SATCON reflects availability of 2 or 3 consensus  
members**

**Dvorak results from JMA include 10min. > 1min.  
conversion to Vmax. and Koba et al. Tnum > Vmax**

.... cue the crickets

CIMSS TC SATCON Wind for 19W

# ***Analysis of Sat-Based TC Intensity Estimation in the WNP***

## **Summary of Preliminary Findings**

**(Based on limited sample of 15 recon validation points)**

- Ave. Vmax estimate errors (kts): Dvorak: **~11** (blind), **~13** (oper), **~14** (ADT)
- Subj Dvorak ave error spread (kts): **8-17** ('blind' analysts), **11-15** (oper agencies)  
[JMA (incl their Koba et al. Tnum>Vmax adjustment) superior to other 2 agencies]
- AMSU (CIMSS) and SATCON ave errors (kts): Both **~ 9** (subset of 13 val. pts)

## **General Preliminary Conclusions**

- **Objective satellite- based methods are very competitive with Dvorak**
